

Reducing Corruption Through Blockchain-Based Transparency Systems

Jonathan Theja - 2602055634

William Irawan – 2602167132

List of Member Contribution:

Jonathan Theja

Jonathan Theja was responsible for the technical development of the research prototype. His contributions included designing the system architecture, developing and implementing the blockchain-based prototype using Solidity on the Ethereum Sepolia Testnet, and building the centralized prototype using Python Flask. He handled the coding of smart contracts, backend development, system testing, and validation of the experimental results. In addition, Jonathan contributed to the preparation of the technical research background and methodology related to system design and implementation.

William Irawan

William Irawan was responsible for the academic writing and documentation of the research. His contributions included drafting and structuring the paper according to the IEEE format, writing major sections such as the introduction, literature review, discussion, and conclusion, and conducting the literature search and reference management. In addition, William created the visual illustrations used in the paper, including system flowcharts, architectural diagrams, and experimental result figures, to support the explanation of both the centralized and blockchain-based systems. He also contributed to developing the conceptual background and aligning the theoretical framework with the research objectives.
